the purpose of this volume of methods in molecular medicine is to set forth examples of the great variety of techniques and applications that are now emerging in the field of nonviral gene therapy the book emphasizes not only specific approaches to gene delivery but in particular the best current methods to prepare handle and characterize gene delivery agents these topics are of very broad importance since gene therapy evolves from its mostly ac emy based experimental and clinical research to the ever increasing number of industry driven

programs directed toward commercial development successful introduction of nonviral gene therapy agents into the clinic should be expected to require rigorous manufacturing and analytical methods that readily meet the regulatory guidelines under which new drug candidates are reviewed for marketing approval exactly what those guidelines will prove to be certainly depends on the established guidelines for review of both biological and chemical therapeutics additionally many new techniques are being devised and applied to gene therapy research these techniques will be instrumental in developing and characterizing successful gene delivery agents nonviral vectors for gene therapy methods and protocols has two main sections to start with there is a series of chapters on specific protocols for the synthesis characterization and application of gene delivery agents several chapters address the topic of materials to bind with dna to form the compact condensed phases that facilitate cellular delivery

various cellular processes underlying plant development and response to environmental cues rely on a dynamic interplay between membranes and the

cytoskeleton e g vesicle and organelle trafficking endocytosis exocytosis and signal transduction in recent years significant progress in the understanding of such interplay has been achieved and several critical links between membranes and the cytoskeleton have been characterized as an example recent work has clarified how auxin promotes the reorganization of cortical actin filaments by the activation of rho gtpase pathways and how such reorganization in turn locally modifies endocytosis and or exocytosis and directs asymmetric distribution of pin family of auxin transporters another recent achievement is the characterization of the rho and microtubule driven mechanism by which the cell wall architecture is established in particular the elegant work by oda and fukuda science 337 p 1333 2012 provides evidence that secondary wall patterning in xylem vessel primarily relies on two processes a local activation of the plant rho gtpase rop11 and a mutual midd1 mediated inhibitory interaction between active rop domains and cortical microtubules additional examples include recent genetic evidence that microtubule and actin filament interacting regulatory proteins such as map65 1 and capping protein function as transducers of membrane lipid signaling into changes in cytoskeleton dynamics and organization this research topic aims at collecting a comprehensive set of articles dealing with cellular processes involving membrane cytoskeleton interactions its scope extends beyond the specific fields defined by the above examples and includes intracellular trafficking host pathogen interactions response to biotic and abiotic stresses and hormonal regulation of growth we hope that this research topic will also highlight critical questions that need to be addressed in the future we welcomed original research articles technical methodological advances e g analysis of cytoskeleton dynamics close to membranes reviews and mini reviews that can expand our understanding of how and why membranes and the cytoskeleton interact
